Open decisions, resolved

Locked wishes: faded, not hidden. A greyed row with an unlock date is the tease — it tells the guesser something is coming and keeps the list from collapsing to empty. Hiding them removes the anticipation the game runs on.

Dedicated hint field. Gives the hider a difficulty dial the AI can lean on, and keeps the Groq prompt clean: title = answer, hint = allowed evidence. Inferring from the title alone makes every wish equally hard and the AI's clues generic.

Chat is scoped per wish. One thread per wish keeps context tight, makes the win/lose transition unambiguous, and matches the row-tap entry point. A single rolling thread would leak clues across wishes.
